Laboratory Reference Ranges in ...

A reference range is a set of values that includes upper and lower limits of a lab test based on a group of otherwise healthy people. By comparing your test results with reference values, you and your healthcare provider can see if any of your test results fall outside the range of expected values and gain clues to help identify possible conditions or diseases.

Reference Ranges and What They Mean | Lab Tests Online

Reference values (intervals) for blood, urine, CSF, stool, and other fluids (eg, gastric acid) and commonly used panels are included. (Note: The reference values provided in these tables should be used as guidelines only.) Reference values vary based on several factors, including the demographics of the healthy population from which specimens were obtained and the specific methods and/or instruments used to assay these specimens.

LABORATORY VALUES (see inside back cover for continuation)

According to the Food and Drug Administration (FDA), normal lab test values are a set of upper and lower limits generally given as a range since normal values vary from person to person. Laboratory tests are commonly administered in discovering the cause of symptoms, confirming a diagnosis and screening for diseases.

Normal Lab Values - Common Laboratory Values

Interpretation. A reference range is usually defined as the set of values 95 percent of the normal population falls within (that is, 95% prediction interval). It is determined by collecting data from vast numbers of laboratory tests. Plasma or whole blood. In this article, all values (except the ones listed below) denote

Lab results are often shown as a set of numbers known as a reference range. A reference range may also be called "normal values." You may see something like this on your results: "normal: 77-99mg/dL" (milligrams per deciliter). Reference ranges are based on the normal test results of a large group of healthy people.

How to Understand Your Lab Results: MedlinePlus Medical Test

Critical Value and Reference Ranges A critical laboratory value is a value at such variance with respect to normal that it represents a pathophysiologic state which is life-threatening unless some action is taken in a relatively short time and for which an appropriate action is possible.
