Network Functions Virtualization (NFV) - Cisco

Network functions virtualization (NFV) is “the decoupling of network functions from proprietary hardware appliances” and using these functions as virtual machines (VMs).⁽¹⁾ A network architecture concept, NFV uses IT virtualization technology to virtualize networks into building blocks that can connect or link up to produce communication services. Although networks are meant to be virtualized using NFV, network functions aren’t meant to be virtualized.

Network Functions Virtualization (NFV) Explained | IBM

NFV allows network operators to manage and expand their network capabilities on demand using virtual, software based applications where physical boxes once stood in the network architecture. This makes it easier to load-balance, scale up and down, and move functions across distributed hardware resources. With continual updates, operators can keep things running on the latest software without interruption to their customers.
