the closed delta connection (using phase current), this give: $V A = 3 V L I p h$. And for the open delta connection: $V A = 3 V L I p h$. Taking the ratio of open delta to closed delta power, gives: $\frac{3 V L I p h}{3 V L I p h} = 0.577$ (or 57.7%) Summary

Heat control is not as accurate as for open Delta. 4. Open Delta. Note that this term is not the same as is used for open delta connected transformers. This system is essentially a normal closed delta configuration with the exception that the thyristor controls are inserted in the phase to element wiring.

The delta function is tricky, but not that tricky. This is an identity for the delta function, so you can replace one with the other anywhere (including under an integral sign). However, as others have pointed out, this is probably a definite integral and by far the best approach is to use polar coordinates as suggested in post #13.
