The algebraic description of Riemannian symmetric spaces enabled Élie Cartan to obtain a complete classification of them in 1926.. For a given Riemannian symmetric space  $M$  let  $(G, K, \sigma, g)$  be the algebraic data associated to it. To classify the possible isometry classes of  $M$ , first note that the universal cover of a Riemannian symmetric space is again Riemannian symmetric, and the covering map ...

For rank one spaces (the hyperbolic spaces), we give an explicit formula for  $\text{fore}(X;Y)$ . Finally, we explain a construction of a general symmetric space by means of Lie series linked to the Campbell-Hausdorff formula, in the spirit of the original Kashiwara-Vergne method.
